## 1 INTRODUCTION

With the approval of the Brazilian General Data Protection Law (LGPD),<sup>1</sup> several software companies need to redesign the way they handle the personal data of Brazilian citizens. LGPD is based on the General Data Protection Regulation (GDPR),<sup>2</sup> which aims at protecting the personal data of EU individuals. In total, around 120 countries adopt comprehensive privacy laws and regulations to protect personal data held by private and public bodies [1]. Nevertheless, for the LGPD success, there must be not only fair regulation enforcement but also technological advancements, which potentially includes adopting new software development tools.

Tim Berners-Lee and colleagues propose a platform named Solid (derived from "Social linked data"), which is can be

defined as a set of principles, conventions, and tools for building decentralized Web applications [REF]. Solid is based on the principle that users should have full ownership their personal data. Currently, applications such as the social networks Facebook and LinkedIn work as "data silos" and all the personal data created in these platforms are controlled by the application companies. In contrast, decentralized Web applications provide complete separation between users' data and the applications that create and consume this data. While users store data in Web-accessible personal online datastores (pods), applications access users data relying as much as possible in W3C standards and Semantic Web technologies [REF]. Pods are by design application-agnostic and as a result users can change the application that consume their personal data at anytime. Despite incipient, Solid's architecture may be considered in several ways a technical solution to the legal framework set by LGPD and several other data protection regulations.

Nevertheless, there are several shortcomings in Solid that still need to be addressed. A significant limitation is the use of Access Control Lists to authorize a subject (e.g., an application).

Some text Here

## 2 BACKGROUND

Here goes some more text.

### 2.1 Brazilian Data Protection Law

Text and more text go here.

### 2.2 Access Control in the Decentralized Web

This document uses ....

## 3 GUARDIAN

## 4 CONCLUSION

## 5 BACKUP NOTES

- These laws not only aim at guaranteeing individual rights, but also at fostering economic growth by establishing rules for the adequate use of personal data.

## ACKNOWLEDGMENTS

To Robert, for the bagels and explaining CMYK and color spaces.
